

**Project Design Phase
Proposed Solution**

Date	29 June 2026
Team ID	
Project Name	Library Book Request System using ServiceNow
Maximum Marks	2 Marks

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	The existing library book request process is manual, time-consuming, and difficult to track. Students face delays in requesting books, while librarians have to maintain records manually, increasing the chances of errors and inefficient management.
2	Idea / Solution Description	Develop a Library Book Request System using the ServiceNow platform. The system enables students to submit book requests online, validates that the issue date is not in the past, automatically generates a unique request number, stores request details securely, and sends an email notification to the librarian upon submission.
3	Novelty / Uniqueness	The solution automates the complete book request process using ServiceNow features such as custom tables, Business Rules, notifications, and form validation. It reduces manual work, improves accuracy, and provides a simple and user-friendly experience.
4	Social Impact / Customer Satisfaction	The system improves library services by providing a faster and more transparent request process. Students can easily submit requests, while librarians can efficiently manage records, resulting in higher user satisfaction and better service quality.
5	Business Model (Revenue Model)	The application is developed for educational institutions to improve library operations. It can be adopted by colleges and universities as part of their digital campus management system, reducing administrative effort and operational costs.
6	Scalability of the Solution	The cloud-based ServiceNow platform allows the application to handle an increasing number of students, librarians, and book requests. Additional features such as request approval, book availability tracking, return management, and reporting can be added in the future without major changes.
